(0:00) So nowadays, the AI-generated art is a hit topic. (0:06) Well, there will be a hidden debate inside this topic. (0:10) So the topic was about should the AI art (0:15) include in the competitions? (0:18) So one of the students thought that it is not worthy (0:22) to include this kind of art in the competitions (0:25) since this kind of art (0:28) did not involve any humanities, (0:30) such as AI cannot understand the painting of Van Gogh (0:38) since the AI just know how to paint a similar painting (0:42) while don't understand the emotions (0:44) and the experience of Van Gogh.

(0:47) So it didn't involve any humanities and creativities (0:51) inside this human art. (0:54) From my perspective, I disagree with this student (0:58) since the data of AI were input by the human, (1:05) so it also involve humanities and human creations. (1:10) So for example, people will enter some code (1:13) and some keywords such as some elements (1:18) like starry night, there will be universe, (1:24) elements, and there will be stars, moons, (1:26) this kind of elements.

(1:28) But this kind of elements need to use by human (1:32) and human need to have this kind of knowledge (1:34) so he or she can enter this code (1:38) or this kind of keywords for AI (1:42) to generate this kind of artwork. (1:44) So it do involve human thoughts, (1:48) human ideas, and human creativity. (1:50) So AI art should be included in the, (1:54) it's worth to include in the competitions.

(1:57) Yes.

Summary Accuracy:

- The summary captured most key ideas, though minor inaccuracies were present (e.g., the term "creativity").
- No personal opinions were included.

Counterargument Quality:

- The counterargument engaged with the claim, providing relevant evidence and some explanation to support its stance, but it lacked depth in elaboration.

Verbal Delivery:

- Speech was fluent with occasional mispronunciations that did not impede communication.
- The student attempted self-reformulations frequently.
- Word choice was appropriate, and expressions were mostly grammatical.

Summary Accuracy	Counterargument Quality	Verbal Delivery	Total
29	22	22	73 (B)

Other comments from teachers:

- "Sum acc: Summarised the point about lacking humanity; but also mentioned that it has no creativity (not mentioned in audio). Missed out the part about struggle and pain (just mentioned emotions and experience generally). Included Van Gogh example but not journalist example; Quality of response: Argued that AI art involves creativity and thought because it is prompted by humans, but this does not address the original argument about the value of struggle and skill in art.
- Verbal delivery: Mostly clear and accurate"
- Summary: includes most main ideas with no personal views. Response Quality: addresses the claim and effective grounds. Verbal delivery: Clear voice, some varied intonation, occasional errors and no pauses."
- summary generally accurate but minor inaccuracies ('creativity') and not comprehensive, well-supported counterargument with some evidence + elaboration, mispronunciations but good fluency
- SA: nuance is lost in "no humanity", "not involve any humanity and creativity" etc.; CQ: counterargument aligns with the claim; VD: "hit topic", "hidden debate" etc.
- captures main ideas in summary and able to use evidence from source in counterargument; clear and easy to understand
- Mid
- Generally able to capture the main idea although the response is not entirely logical nor effective.
- Summary covers some of the main points, but the summary is rather brief. The counterargument directly addresses the claim in the argument in the recording. Speech is fluent. Word choice can be improved though.
- Quite logical speech and good reasons provided. Innovative as well.
- "The claim Was summarized well. It was easy to follow with smooth delivery. But the delivery could have been better "
- articulation generally ok but many language errors affecting the summary of the ideas. I can see some relevance of the counterargument.
- Generally fluent, ideas are clear but might lack effective transitional phrases to enhance their cohesion. Evidence in summary is limited.
- The student reduces the argument to “AI just knows how to paint similar paintings” and “lacks humanities,” which somewhat oversimplifies and misses the original emphasis on authenticity, soul, and lived experience. The opposition does not directly address the main part of the original claim (circular reasoning + shallow argument).
- Student was able to summarize reasonably well and then provide a counterargument. The English speaking was smooth and relatively easy to follow.
- Included most of the major points. Counterargument addresses the argument.

- The student failed to provide a definition of the concept and the claim she summarized is not very accurate. The counterargument is not very valid with supporting evidence. The speaker is somewhat fluent in English but with pauses and fillers.
- Lots of self-corrections really hindered the fluency.
- the refutation addresses the counterargument
- Some hesitation and repetition in speech. Both summary and counterargument contain chiefly of claim and are not well supported by evidence or explanation.

(0:00) Recently, some people argue that AI can potentially replace therapy for mental health. (0:11) However, I do not agree with that. (0:14) Recently, there are a growing number of use of AI in a lot of mental-helping apps, (0:21) and there are some reasons for that, like they have some mood-tracking abilities to track the users for their daily mood and see if they need help.

(0:37) They have chatbots to chat with the users to help them relieve the stress or to help to talk with someone. (0:46) However, this is not a reason that it can replace therapy, but only as a side tool to help therapy be more effective (1:03) because mental therapy has a real person that can talk to you to provide a solution for your problem in your life, (1:15) and which chatbots can only talk to you and cannot provide any real support.

(1:23) And also, people say that people that cannot access to therapy that live too far or have lower income, (1:36) they can still find therapy from community centers or something like that, (1:42) and they still have quality therapy and get better help than chatting to a non, that is not a live object.

Summary Accuracy:

- The topic was "AI-powered mental health apps", not just "AI".
- The summary was brief but included some key points, though part of the main ideas appeared in the counterargument section.

Counterargument Quality:

- The first counterargument ("mental therapy…provide a solution…, chatbots …cannot provide any real support") was valid but did not directly address the claim.
- The second counterargument ("live too far or have lower income… and still find therapy from community centres…") was underdeveloped, lacking supporting evidence.

Verbal Delivery:

- Speech was generally clear, with minor mispronunciations that did not impede communication.
- Ideas were sometimes fragmented due to a lack of clear signposting.
- Some expressions were ungrammatical, and word choice was occasionally basic.

Summary Accuracy	Counterargument Quality	Verbal Delivery	Total
24	19	20	63 (C+)

Other comments from teachers:

- "Sum acc: disorganised summary; introduced the summary by stating his own view (disagreement); CA Quality: the argument was about increasing access to therapy; but his CA was about the low quality of AI therapy; contradicted the original argument but without grounds (e.g. AI chats cannot provide real support; help via a community centre is better than from an non-live object); Verbal delivery: not smooth; can express ideas but not very precise"
- "Summary accuracy: A little confusing as he started the summary and jumped to his opinion then went back to it. Lack of details. Response quality: Addressed the claim and had fairly effective grounds. Verbal delivery: Some pronunciation errors."
- missing multiple main points, very poorly supported counterarguments, a bit flat-toned but pronunciation and fluency generally ok
- SA: the speaker's claim & reason (i.e. idea on accessibility) are not clearly articulated; CQ: the first part of the counterargument doesn't align with the claim, while the second one does address accessibility but is under-developed; VD: organisation issues, "something like that", "that is not a life object"(?)
- did not summarize the passage and begins immediately with counterargument; uses personal pronoun and opinion when giving argument; needs to include transitional words/phrases to introduce other point about finding a place for therapy; he can include more specific evidence/examples to support his claim; minor grammatical errors but able to understand him
- Low
- Omits several key ideas and misinterprets; own response to the claim is not strong enough.
- Missed some key points in the summary; not easy to follow the flow of ideas; the counterargument lacks a clear focus. Speech is mostly clear and fluent.
- More grammatical errors in sentences. Unfinished sentences - unfinished thoughts
- There was a lot of hesitation and wrong use of vocab. The claim was not summarized clearly
- The summary is not structured though he can finally include some details that are relevant. The refutation is more effective.
- Counterargument seems to have missed the point of the argument; not responding to the original argument. Extract is used as a source of evidence for different parts of the response, instead of being summarized as a whole.
- Confusing in the beginning due to misspeaking the argument as "I". After that, the meaning was hard to interpret and there were notable hesitations.
- misinterpretations, no clear summary, include personal views, weak counterargument, lack of effective evidence
- The summary was not well organized. A portion of the counterargument was related to the original speaker's claim, but most of it was not.

- The student barely summarizes the original text at all. The student argues against total replacement, but the original text does not actually claim that AI will completely replace therapy for everyone.
- The student did not summarize the main claim or the definition of the concept. The counterargument is very informative and interesting. The speaker anticipates a number of pauses and fillers.
- The response can be hard to follow at times. It can have a clearer structure
- The response does not contain summary. The counterargument contains a couple of points supported by evidence, but these points are not directly addressing points raised by the claim (bots being trained on cognitive theory).
